

tradeforme — Next Steps

Action list of things only **you** can do. Everything below is blocked on your input, your credentials, or your decision — not on more code.

Where the project stands

Repository	https://github.com/EtixP/tradeforme (private)
Branch	main
Milestones done	M1, M2, M3 (deterministic extraction, 96.2% OK), M4, M5 (signals stored), M6/M7 paper
Tests passing	88 / 88
Disclosures in DB	111,622 across 60 trading days (Feb 27 – May 27, 2026)
Supply-contract events	533 candidates → 513 OK + 20 manual-review (19 value-undisclosed, 1 ratio-inconsi
Real contract values extracted	513 events with verified contract_value, prior_year_revenue, ratio
Candidate signals stored	331 at default threshold (ratio ≥ 0.08); 58 at strict threshold (ratio ≥ 0.30)
Price data source	pykrx (free, no auth)
LLM extraction	Code complete (prompts + validator + client) — optional now that deterministic parser wo
Broker integration	PaperBroker (historical fills) ready; KIS broker needs your credentials

Threshold sweep: net-of-cost returns by ratio cutoff

514 contracts with real extracted values, returns measured from event-day close to T+1/T+5 close, net of 0.313% roundtrip cost. The CLAUDE.md hypothesis (filter to ratio ≥ 0.08) is the line marked « in the table.

Threshold	n	T+1 net	T+5 net	T+1 win%	T+5 win%	Profit factor (5d)
0.00 (all)	514	+0.35%	+1.21%	42.6%	44.2%	1.38
0.05	430	+0.43%	+0.95%	43.7%	42.8%	1.30
0.08 «	333	+0.39%	+0.55%	41.7%	42.3%	1.20
0.10	287	+0.54%	+0.87%	40.8%	44.3%	1.27
0.15	169	+0.18%	+0.89%	38.5%	46.2%	1.26
0.20	110	+0.49%	+1.15%	38.2%	45.5%	1.33
0.30	59	+1.64%	+3.10%	40.7%	42.4%	1.93
0.50	23	+1.78%	+2.67%	30.4%	39.1%	1.77

Key finding: the CLAUDE.md-suggested 8% threshold underperforms the unfiltered baseline (T+5 net +0.55% vs +1.21%). The 30%+ threshold shows real edge — T+5 net +3.10%, profit factor 1.93 — but on

only 59 events, well within noise.

What this means: the project's actual research question now has a partial answer: small-to-medium supply contracts do NOT show a tradable post-disclosure drift, but very large ones ($\geq 30\%$ of revenue) might. To confirm, the system needs more data — *backfill* is now the highest-leverage next move.

Raw CSVs: `data/event_study_results.csv` (all 533) and `data/event_study_filtered.csv` (ratio ≥ 0.08).

Action items

Sorted by priority. P1 unblocks the next milestone. P2 hardens the existing system. P3 is optional polish.

Priority	What	Why	How
P1	Authorize a larger backfill (12+ months)	Strongest finding so far: very large crypto backfill 12-300k hist (or +6.16m this 5, not longer only 350k)	Deploy to backfill 12-300k hist (or +6.16m this 5, not longer only 350k)
P1	Rotate the DART API key	The current key briefly appeared in data maps during the ██████████ smoke test (██████████) Replace DART	██████████
P2	Get an LLM API key (Anthropic)	Democratize AI on P1: optional stic parsers (see last 96%) of supply chain trace with LLM (Add The	██████████
P2	Set up GitHub branch protection	Once live trading code exists, you don't want to stray from a main to Settings L1V Branches by ac	██████████
P2	Back up data/kdtb.db	111k rows of ingested DART data — Easiest: rentable Cloud Drive backup of min the Desktop 90 days	██████████
P2	Schedule daily DART ingestion	Right now ingestion only runs when you invoke the CLI manually Desktop free for disc 6.8 server	██████████
P2	Obtain KIS broker credentials	Required for Milestone 6 (broker integration) was beyond Se (copies live ██████████) When Open W&P	██████████
P2	Decide whether to raise min_coin_age to threshold sweep	Data from this loop's time threshold sweep (arguably fine) of CLAUDE mid-strategy of 0.001 is supply sec 0.02	██████████
P2	Review risk thresholds in config	Default: 100k CLAUDE.md (██████████) 30k Open config 10k daily loss Pay attention > 0.80 in these ex_	██████████
P3	Install gitleaks pre-commit hook	Catches an accidental commit of .env or API keys gitleaks & gitleaks git hook - Belated & unstable	██████████
P3	Decide if PDF action lists should be created	Currently METEOR_STEPS.pdf will be created as a plan for METEOR_STEPS work to mitigate a prefer giten	██████████
P3	Decide on Korean market holidays	Big handling the ingestion CLI runs even on holidays Optional add daily DART calendar (only for today, business	██████████

Where to find things

Project root	/Users/jsp2022310/Desktop/tradeforme
Repo on GitHub	https://github.com/EtixP/tradeforme
Project spec	CLAUDE.md (in repo root)
Source code	src/kdtb/ — schemas, config, data, strategy, risk, storage
Tests	tests/ — run with: <code>.venv/bin/pytest</code>
DART ingestion CLI	<code>scripts/ingest_disclosures.py --date YYYY-MM-DD</code>
Event study CLI	<code>scripts/run_event_study.py [--limit N]</code>
Parse docs CLI	<code>scripts/parse_supply_contracts.py [--limit N]</code>
Filtered event study	<code>scripts/run_filtered_event_study.py [--min-ratio 0.08]</code>
Strategy runner (NEW)	<code>scripts/run_strategy.py [--min-ratio 0.30] [--dry-run]</code>
Local DB (gitignored)	data/kdtb.db — SQLite, inspect with sqlite3 or DB Browser
Event study CSV	data/event_study_results.csv
Secrets (gitignored)	.env — DART_API_KEY lives here
Config	config/default.yaml, config/paper.yaml, config/live_tiny.yaml
Live-trading guard	src/kdtb/config.py — raises if YAML says LIVE without <code>ENABLE_LIVE_TRADING=true</code> in

How to verify the project is healthy

Run these from the repo root any time you want to confirm nothing is broken:

```
.venv/bin/pytest
```

```
.venv/bin/python -m kdtb.main
```

```
.venv/bin/python scripts/ingest_disclosures.py --date $(date +%Y-%m-%d)
```

What Claude built across the autonomous loops

Loop 1 (M4 + M5):

- **data/market_data_client.py** — pykrx wrapper for OHLCV + event-time returns
- **scripts/run_event_study.py** — batched event study CLI
- **strategy/major_supply_contract.py** — M5 strategy engine (was placeholder)

Loop 2 (cost model + M3 prep + paper broker):

- **backtest/cost_model.py** — Korean equity costs
- **backtest/metrics.py** — per-trade metrics
- **interpretation/llm_prompts.py, extraction_validator.py, llm_client.py**
- **broker/base.py + broker/paper_broker.py**

Loop 3 (deterministic extraction + filtered event study):

- **data/dart_client.py** — new `fetch_document_text()` + ZIP/HTML/UTF-8 extractor
- **interpretation/deterministic_parser.py** — regex parser for ■■■■■■■■■■■■ (voluntary + mandatory variants)
- **storage/extraction_store.py**, **scripts/parse_supply_contracts.py**, **scripts/run_filtered_event_study.py**
- 16 new test cases

Loop 4 (end-to-end signal generation + parser refinement):

- Parser refinement: distinguishes 'value undisclosed by company' (literal dash in form) from 'value missing entirely'. Previously 18 rows were marked 'blocked'; now 0 blocked and 19 are correctly flagged `value_undisclosed_by_company` in `needs_manual_review`.
- **storage/signal_store.py** — upsert keyed on `signal_id` (UNIQUE), plus clear-by-strategy
- **scripts/run_strategy.py** — runs strategy engine across all extractions, tallies rejections by reason, stores Signal rows. `--min-ratio` override and `--dry-run` flags.
- End-to-end pipeline now operational: **331 candidate signals stored in DB** at default threshold (0.08), 58 at the empirically-better 0.30 threshold. Mean strength 0.76, range 0.40–1.00.
- 4 new test cases (signal store + value-undisclosed parser test)

Suite: 28 → 43 → 68 → 84 → **88** passing tests. Zero regressions across four loops.

Honest caveats

- The naive event study uses title-only filtering. It does not separate small contracts from large ones, so noise dominates. M3 (LLM extraction) is needed to filter by contract/revenue ratio.
- The event date used is the DART receipt date (YYYYMMDD). Intraday timing of the disclosure is not captured. If a disclosure is filed at 14:00 KST, our 'T+1' return actually includes the price reaction from 14:00 to next-day close, not a clean next-day-only return.
- Returns are raw close-to-close, not benchmark-adjusted. A market-wide rally on event days would inflate the mean.
- pykrx scrapes the KRX website. It's free but can be rate-limited. We sleep 0.15s between calls.
- LIVE_TINY broker code is not yet implemented. Even with KIS credentials, no real orders can be placed yet.
